

Kemutec Supplies Mill and Conveying Package to Volac International

Kemutec, one of the worlds leading global suppliers of powder process machinery and flow control equipment, has announced that it has supplied a KEK 2H Universal Mill and a conveying package to Volac International at its site in Felinfach, Wales.

Volac initially specialized in the production of Permeate for use in animal feeds and supplements. The company wished to diversify and offer more valuable variations of its products, and as a result, focused on extracting Lactose from the Permeate for infant formula. A new production line was therefore required.

Following initial enquiries and tests with a highly experienced Kemutec Sales Engineer, it was decided that a KEK 2H Universal Mill would be best suited to achieve the specified 2.5 tons per hour throughput. The Universal Mill supplied is a standard design, made from 304 stainless steel, and sits on a standard 2H Mill bed.

However, this was only part of the comprehensive solution offered to Volac. The milling system, designed and manufactured by Kemutec, had to be split over two floors in order to fit the available space. This necessitated pneumatically conveying milled material directly from the Mill to a collection hopper on the floor above, which features an inspection hatch, and sits on a custom frame.

The whole system is protected against a dust

explosion by a flameless vent and explosion check valves. Conveying air is cleaned through a reverse jet filter before being discharged directly into the building.

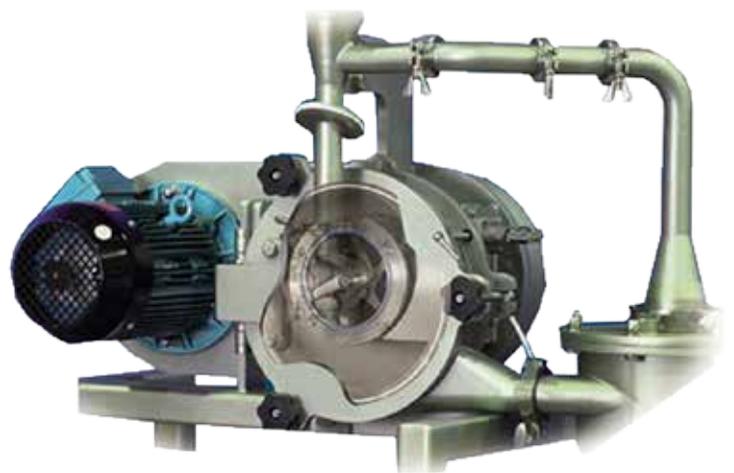

This extensive and innovative solution highlights how Kemutec is constantly responding and adapting to the needs of its customers, and highlights how it maintains its position as a world leader in powder process and flow control equipment.
